1. General Description

The DW8505A is an instant On/Off LED driver for low power LED applications. At DW8505A output stage, one regulated current port is designed to provide a uniform and constant current sink for driving LEDs within a large range of V_F variations.

DW8505A easily provides users a consistent current source. User may adjust the output current from up to 100mA through an external resistor R_s , which gives users flexibility in controlling the light intensity of LEDs. In addition, users can precisely adjust LED brightness from 0% to 100% via output enable (EN) with Pulse Width Modulation.

DW8505A also guarantees that LEDs can be cascaded to maximum 40V at the output port.

■ Pin Description

No.	Pin Name	Description	Note
1	EN	Output stage enable control pin. High enable the OUT pin. Dimming control is possible by PWM(Pulse width modulation). Typically, It operates under 30kHz.	
2	GND	Ground	
3	RS	Output current set input. Connect a resistor from RS to GND to set the LED bias current.	
4	VDD	Supply voltage input.	
5	OUT	Output pin. Sink current is decided by the current on R _{SET} connected to RS.	

4. Absolute Maximum Ratings

Symbol	Parameter		Ratings
VDD	Supply voltage		41V
V _{EN}	Enable voltage		41V
V _{OUT}	Output voltage		23V
VRS	Reference voltage		5V
θ _{JA}	Package thermal resistance	SOT-23-5L	38.59°C/W
T _{OPR}	Operating temperature		-40~+85°C
T _J	Junction temperature		+150°C
T _{STG}	Storage Temperature		-55~+150°C

Note 1. θ_{JA} is measured in the convection at Ta=30°C on a high effective thermal conductivity

test board(4 Layers, 2S2P) of JEDEC 51-7 thermal measurement standard.

2. PCB dimension is 100x100x1.6mm and 4 layers.

■ Absolute Maximum Ratings

Use of the IC in excess of absolute maximum ratings such as the applied voltage or operating temperature range (T_J) may result in IC damage. Assumptions should not be made regarding the state of the IC (short mode or open mode) when such damage is suffered. The implementation of a physical safety measure such as a fuse should be considered when use of the IC in a special mode when the absolute maximum ratings may be exceeded is anticipated.

5. Recommended Operating Condition

■ Power sequence

There is an electrostatic diode between VDD and EN.

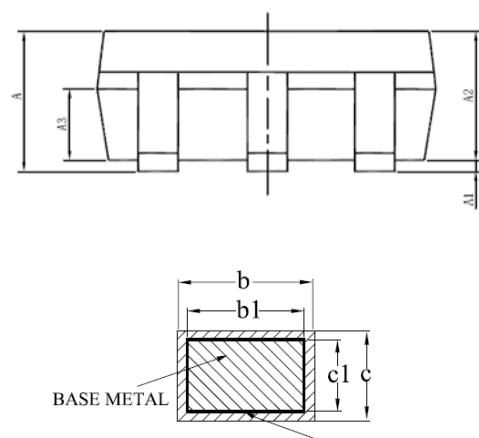

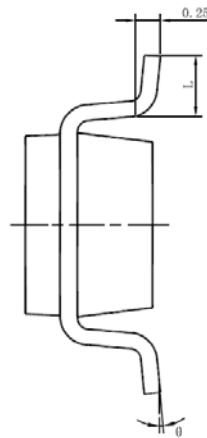

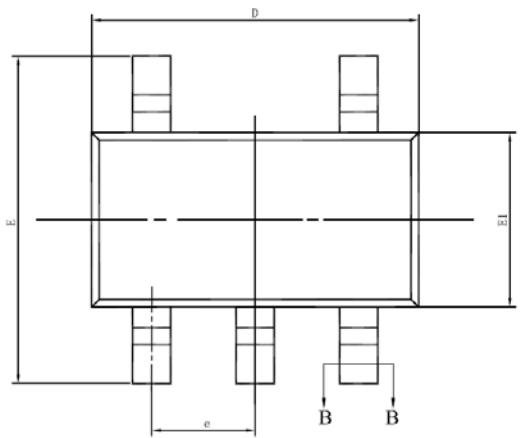

When dimming control, It must input EN signal after inputs VDD. ($t \geq 1\text{ms}$)
If not use Dimming control, EN connect to VDD.
